IN THE CLAIMS:

Claims 1-10 are currently pending in the present application.

Please amend Claims 1 and 7-10 as set forth below.

CLEAN COPY OF CLAIMS

1. (Once Amended) A reflective type fringe field switching mode liquid crystal display ("a reflective FFS-LCD") comprising:

a liquid crystal layer having a plurality of the liquid crystal molecules;

a first substrate disposed on one side of the liquid crystal layer and a counter electrode and a pixel electrode formed on the first substrate for generating a fringe field to drive the liquid crystal molecules;

a second substrate disposed on the other side of the liquid crystal layer;

a first homogeneous alignment layer interposed between the liquid crystal layer and the first substrate and having a rubbing axis in a selected direction;

a second homogeneous alignment layer interposed between the liquid crystal layer and the second substrate, and having a rubbing axis in a selected direction;

a polarizer disposed on an outer surface of one of the first substrate and the second substrate, and having a selected polarizing axis; and

a reflective plate disposed on an outer surface of the other of the first substrate and the second substrate,

wherein retardation occurs in the liquid crystal layer by $(2n+1)\lambda/4$ when the liquid crystal molecules in the liquid crystal layer are driven by the fringe field and wherein λ is the wavelength of light and n is zero or a positive number.

7. (Once Amended) A reflective FFS-LCD comprising:

a liquid crystal layer having a plurality of liquid crystal molecules;

a first substrate disposed on one side of the liquid crystal layer and a counter electrode and a pixel electrode formed on the first substrate for generating a fringe field to drive the liquid crystal molecules;

a second substrate disposed on the other side of the liquid crystal layer;

a first homogeneous alignment layer interposed between the liquid crystal layer and the first substrate and having a rubbing axis in a selected direction;

a second homogeneous alignment layer interposed between the liquid crystal axis in a selcected direction anti-parallel to the rubbing axis of the first homogeneous alignment layer;

a polarizer disposed on an outer surface of one of the first substrate and the second substrate, and having a selected polarizing axis; and

a reflective plate disposed on an outer surface of the other substrate of the first substrate and the second substrate,

wherein the rubbing axes of the first and the second alignment layers are at an angle of 10 to 85° with a substrate projection line of the fringe field,

wherein retardation occurs in the liquid crystal layer by $(2n+1)\lambda/4$ when the liquid crystal molecules in the liquid crystal layer are driven by the fringe field and wherein λ is the wavelength of light and n is zero or a positive number.

8. (Once Amended) The reflective type FFS-LCD according to claim 7, wherein the rubbing axes of the first and the second alignment layers and a polarizing axis of the polarizer coincide.

9. (Once Amended) The reflective type FFS-LCD according to claim 7, wherein the rubbing axes of the first and the second alignment layers and the polarizing axis of the polarizer are at an angle of 20 to 60°.

A3 Cont.

10. (Once Amended) The reflective type FFS-LCD according to claim 9, wherein the rubbing axes of the first and the second alignment layers and the polarizing axis of the polarizer are at an angle of 45°.
